

New Flu Vaccine!

Wednesday, 30 November 2011 10:22

In the near future...you may be seeing a different kind of flu vaccine. An experimental DNA plasmid vaccine appears to overcome some of the limitations of current vaccines by offering protection against a wide variety of strains, report researchers. So is it just science fiction? One local doctor says nope.

Dr. C.J. Menagh with Mayo Clini Health Systems, says the current vaccines people recieve are outdated and he will be watching this latest DNA trend. But in the meantime, Menagh recommends you should still get a flu shot every year.
